```

Had difficulty importing the dataset into mongoDB. I tried using the shell to import the csv file locally but kept facing an error that made application close down. I also tried manually importing a json file into the database but kept receiving an error.

Redis

The image shows the Redis Cloud console interface for a database named "Ryan-free-db" (Database #12622832). The console displays the general configuration, including the database name, subscription, public endpoint, and tags. The database is hosted on GCP in the North America (Iowa) region, us-central1. The Redis version is 7.0.15, and it was created on 28-Oct-2024 at 22:17:16.

Below the console, a Python script is shown in a code editor, demonstrating how to connect to the Redis instance and insert data from a CSV file into a Redis database. The script uses the `redis` and `pandas` libraries. It connects to the Redis instance using the provided endpoint and credentials, and then iterates over the CSV data to insert each row as a JSON string into the Redis database.

```
16
17 import redis # type: ignore
18 import json
19 import pandas as pd
20
21 # Connect to Redis
22 try:
23     r = redis.Redis(
24         host='redis-14548.c253.us-central1-1.gce.redis.cloud.com',
25         port=14548,
26         password='56f704xT1SHHueCPOXBf0118a5dpl1l',
27         decode_responses=True # Ensures data retrieved is in string format
28     )
29
30     # Verify connection
31     if r.ping():
32         print("Connected to Redis!")
33     else:
34         print("Failed to connect to Redis.")
35
36 except redis.ConnectionError as e:
37     print(f"Redis connection error: {e}")
38     exit(1)
39

Ps C:\Users\lyana\

```

BigQuery

- Pretty simple process
- Create new dataset within bigquery on GCP
- Uploaded the provided data as a table manually within the bigquery dataset
- Ran the SQL query on a dataset to retrieve patients over the age of 40.
- Monitoring tools are useful to view resource usage and cost estimates
- Clear structured layout for datasets, tables and queries

MongoDB

- Created a mongoDB account and set up a new cluster
- Created new database and collection to store the healthcare data
- I used a python script using pymongo to read the csv file and convert each row to JSON format
- I used the query functionality to retrieve records where the patients age was over 40
- Pretty user friendly and eas to set up
- Flxible document based approach

Redis

- Created new redis cloud account and new database instance
- I made a python script using the redis library
- Retrieved and updated data by querying patient records based on their ids
- Very minimal and clean interface
- Key value storage
- Efficient and simple fast data retrieval but best suited for scenarios with key value pairs data
